LESSON OVERVIEW

What should students know/do by the end of this week's lessons?

Students will develop their understanding of selection and the Boolean conditions used to control it. They will evaluate comparisons and combine conditions to describe a permitted range. Students will then use if, elif and else to classify values, explaining the importance of indentation and branch order. They will use values at and around thresholds to check that the program implements the intended rules.

End-of-Week Assessment/Check: How will you know they got it?

Teacher questioning, discussion of worked examples, the completed student tasks and the final checks in both lessons. Check equality at the threshold and explain why each test is True or False. Require correct boundary results and an explanation of branch order. Check that students can explain their reasoning and apply the skill without relying on the worked example.

LESSON SLOTS - MONDAY & FRIDAY

Lesson	Date	Learning Objective	The Lesson Flow	Differentiation
1	28 September 2026	By the end of this lesson, students will be able to construct and evaluate Boolean conditions for selection.	**H:** Ask whether a score equal to the pass mark should pass. Invite students to explain their prediction before demonstrating the example. Use their responses to identify the idea that needs clarification. **ID:** Explain comparison operators and Boolean results; introduce and, or and not. Explain equality and inequality comparisons and show that each comparison evaluates to True or False. Discuss how and requires both conditions to be true, while or permits either condition to be true. **WD:** Evaluate conditions for eligibility based on age and permission. Use a permitted age interval of 12 to 18 and compare a correct and condition with an incorrect or condition. Substitute ages of 11, 12, 18 and 19 and explain the	**Support:** Provide a comparison-operator reference and number-line diagrams. Start with one condition before combining two. Ask students to read each expression as a complete sentence and explain each Boolean result. **Extension:** Students use not to express the opposite condition and check it against the original interval test. They identify a redundant condition and justify a simpler equivalent expression.

			result of each comparison. **YD:** Write and test conditions for a score threshold and a permitted age range. Students record conditions and predicted Boolean results before running them. They test the endpoints and outside values, then explain why a condition that appears reasonable may accept an unintended value. **C:** Check equality at the threshold and explain why each test is True or False. Ask students to support their answer with a specific example from their work, and record any misconception that needs a further demonstration.	
2	2 October 2026	By the end of this lesson, students will be able to use if elif and else to select one suitable outcome.	**H:** Show overlapping grade rules in an incorrect order. Invite students to explain their prediction before demonstrating the example. Use their responses to identify the idea that needs clarification. **ID:** Explain indentation and why the first true branch is selected. Explain that Python evaluates if and elif conditions in order and executes the first matching branch. Indentation defines the statements belonging to a branch; else handles the remaining cases. **WD:** Build a three-band score classifier using ordered conditions. Use three score bands: below 50, 50–79 and 80 or above. Trace scores of 49, 50, 79 and 80. Show how putting a broad condition first can prevent a more specific branch from being reached. **YD:** Create and test the	**Support:** Provide a branch diagram and an indented code skeleton. Complete the first comparison together and supply the band labels. Use the same boundary values in the diagram, code and test table. **Extension:** Students compare two correct arrangements of the conditions and explain why each works. They add a preliminary range check for 0–100 and justify where it belongs.

			classifier with values below, at and above each threshold. Students save their classifier with labelled output and a test table. They record the expected band for each boundary case, compare actual results and correct either the comparison or the order when necessary. **C:** Require correct boundary results and an explanation of branch order. Ask students to support their answer with a specific example from their work, and record any misconception that needs a further demonstration.

MATERIALS NEEDED FOR THE WEEK

- Pearson Edexcel International GCSE Computer Science Student Book: Chapter 5
- Teacher computer and classroom display
- Classroom computers with Python 3 editor and individual save folders
- Prepared algorithm, tracing or Python practice tasks aligned with the lesson objectives
- Whiteboard and markers
- Student notebooks and pencils
- Success criteria, test tables and teacher observation checklist

END-OF-WEEK REFLECTION

- What worked well?

- What flopped or confused students?

- What needs to be re-taught or adjusted next week?
